A rubbish tip, also known as a landfill, is a site where waste materials are disposed of in a controlled manner. These sites are often located in areas that are far away from residential areas, as they can be harmful to the health and well-being of people living nearby.

There are several reasons why a rubbish tip should not be built near a residential area. First, rubbish tips can produce harmful gases, such as methane and carbon dioxide, which can be released into the air and cause health problems for nearby residents. Additionally, rubbish tips can attract vermin, such as rats and mice, which can spread disease and cause further health problems for people living nearby.

Furthermore, rubbish tips can have a negative impact on the environment. They can contaminate groundwater and soil, which can have long-term effects on the surrounding ecosystem. The leachate produced by rubbish tips can also pollute nearby waterways, which can harm aquatic life and make the water unsafe for human consumption.

In addition to the health and environmental concerns, rubbish tips can also have a negative impact on property values. The presence of a rubbish tip can make it difficult for homeowners to sell their properties, as potential buyers may be deterred by the health and environmental risks
